

The foot ulcer buster

Prevents foot ulcer

What happens when you wheel the term 'well-heeled' through hospital doors? You get a transformation of the word not just applicable to the rich.

Patients-in-splints often run head on with foot ulcers, mainly caused by the splint which is made of hard material and traps moisture. QC team Chemistry consists of a team whose roles expose them to more feet than the average person. Their invention of a foot support device that is well cushioned, lends good support and allows proper air circulation was created after rounds of trial and error. The new device ensured that foot ulcers will not result when a patient has to be put

on a splint. Nurses no longer need to remove the foot support for checks at regular intervals. Our patients are happier when they can concentrate on regaining their mobility. We call this innovation.
